Start now

Download data template specific to your activity. If information isn't available, you'll use the parameters of projects like yours (value ranges).

03 Collect data

Development & installation

All investments to implement the energy production facilities (studies, materials, grid connexion...)

Energy revenues

Depending on the support mechanisms for renewable energy projects you choose : Feed-in tariff, call for tender , Power Purchase Agreement, Self-consumption

Start now

Download data template specific to your activity. If information isn't available, you'll use the parameters of projects like yours (value ranges).

Operating cost

All costs to run the energy production facilities and the company including loans cost, taxes, stakeholders revenue...

Other incomes

In case your company provide others services or deliverables (project development services, buying groups...)

04 Build up

Build your own

Now that you have datas, you can evaluate your project economic viabilty's with a excel business plan
Each compagny has its own template and no universal calculation can be made, because regulation, tarriff are constantly evolving.
The best advice we can give is to create your own business plan. Starting from a table that you don't know, or worst that you don't understand, will lead you to mistakes.

Step by step

The keys steps to understand the basics concepts usefull to build your own business plan.

Get inspired

Download existing business plan to help you create your own.

Work in progress

Business plan isn't set up for the project life time, many parameters will evolve along development, you need to update it and analyse changes.

05 Go further

Business model is one aspect of your project but you should also take care of

Additionnal benefits

Benefits generated by energy community reinvested into the neighborhood.

Legal entity

Feedback about adapted legal entity for energy community

Risk analysis

Evaluate your project sensivity to risk.
